The prior art of record fails to disclose or suggest the recited implantable tissue fixation device with multiple portions with differing cross-sectional areas arranged on a common longitudinal axis and comprising an at least partially crystalline polymer which is molecularly oriented throughout the device, wherein the common longitudinal axis of the device is the axis of molecular orientation throughout the device, wherein the portion with the smaller cross-sectional area are more highly oriented than the portion with the larger cross-sectional area (claim 44), and wherein: (1) the device comprises a head portion and a shank portion, wherein the shank portion is more highly oriented than the head portion (claims 1, 23, 43). NAKAMURA ET AL discloses devices wherein portions of the device's molecular orientation deviate from the longitudinal axis of the device; BURKHEAD ET AL and TORMALA ET AL (US 6,228,111) fail to disclose devices with the same axis of molecular orientation throughout the device in combination with differing degrees of orientation longitudinally arranged along the device; GILBERT ET AL '299 and SHIKINAMI ET AL (US 5,981,619) and SHIKINAMI ET AL (US 2003/0006533) fail to disclose articles with differing cross-sectional areas with differing degrees of orientation which all lie in the longitudinal axis of the device;
